## MICRO-FABRICATED OPTICAL WAVEGUIDE FOR USE IN SCANNING FIBER DISPLAYS AND SCANNED FIBER IMAGE ACQUISITION

#### **Related Applications**

This application is based on a prior copending provisional application Serial No. 60/253,445, filed on November 27, 2000, the benefit of the filing date of which is hereby claimed under 35 U.S.C. § 119(e), and is a continuation in-part of U.S. Patent application, Serial No. 09/850,594, filed May 7, 2001, the benefit of the filing date of which is hereby claimed under 35 U.S.C. § 120.

#### Field of the Invention

The present invention generally relates to optical fiber scanners, and more specifically, to a micro-fabricated optical fiber that is driven at resonance to scan a relatively large field of view.

### **Background of the Invention**

Most optical scanning applications use a moving mirror, either rotating or oscillating. A laser beam is often projected onto the moving mirror to scan the beam across a specified linear or two-dimensional (2D) (raster) pattern at a frequency that is sufficient for the particular application. For optical displays, the field of view (FOV) is determined by the scanning amplitude and the particular optical design. There is a minimum frequency (rate) at which scanning displays need to be refreshed, which is determined by the human perception of flicker from a scanned display. For ubiquitous raster scanning displays, such as cathode ray tubes (CRTs) used in televisions and computer monitors, the display refresh rate is typically 30 to 60 Hz. Although a CRT employs an electron-beam for scanning an electro-optical display screen, the same requirements for scan frequency and amplitude (that determine the FOV) generally apply for all types of scanning displays. Thus, for a super video graphics array (sVGA) display having a CRT resolution of 800x600 pixels, the
